For the analysis of the trends, the following approach was followed:

- Increasing trend: When both morbidity and death trends showed increase in the past three days.
- Passing the first epidemic pick: When morbidity trend is decreasing but death trend is increasing.
- Declining trend: When both morbidity and death trends in the past three days are decreasing.
- Controversial observations: Observations other than above mentioned patterns or extraordinary observations exist.

It seems that in six provinces a new wave of epidemic has been started (i.e., in Tehran, East Azerbaijan, Kohkiliyeh and Boyer-Ahmad, Khuzestan, Gilan and Mazandaran). Five provinces have probably passed an epidemic peak in recent days (i.e., Isfahan, Ilam, South Khorasan, Hamedan and Khorasan Razavi). Four provinces show a declining trend (i.e., Markazi, Qom, West Azerbaijan and Kerman). Controversies in the data did not allow rigorous interpretation of the epidemic situation in fourteen provinces (i.e., Alborz, Semnan, Yazd, Qazvin, Zanjan, Ardabil, Lorestan, North Khorasan, Golestan, Chaharmahal and Bakhtiari, Kermanshah, Sistan and Baluchestan, Bushehr and Hormozgan). It should be noted that a province can experience several consecutive epidemic waves.

For further details about methods and provincial trends in the last few days, please visit COVID-19 Epidemiology Committee website at http://corona.behdasht.gov.ir.
